

Client Brief (Problem Statement)

We are a growing cybersecurity company managing multiple clients across different regions. Over the past year, we've experienced an increase in security incidents, but we currently lack a centralized view to monitor and analyze these threats effectively.

Our Security Operations Center (SOC) team is struggling with:

- No clear visibility into **total incidents and trends over time**
 - Difficulty tracking **response times and team efficiency**
 - Limited insight into **data breaches and system uptime performance**
 - No structured way to monitor **incident severity and risk levels**
 - Lack of understanding of **where attacks are coming from (countries & regions)**
 - No clear breakdown of **attack types (phishing, malware, SQL injection, etc.)**
 - Challenges in identifying **top threat groups and patterns**
 - Manual and scattered logs making it hard to track **critical incidents and resolution time**
-

What We Need

We need an **interactive, executive-level dashboard** that will:

1. Provide a **high-level overview of security performance**
 2. Track **incident trends monthly and yearly (YoY comparison)**
 3. Monitor **average response time and operational efficiency**
 4. Highlight **data breaches and firewall/system uptime**
 5. Break down incidents by:
 - Severity (Low, Medium, High, Critical)
 - Risk level
 - Attack type
 6. Show **attack sources by country and region**
 7. Identify **top threat groups responsible for attacks**
 8. Include a **detailed incident log** for operational tracking
-

Goal

The dashboard should help management:

- Detect patterns and trends early
- Improve response time and reduce risks
- Allocate resources effectively
- Strengthen security strategy based on real data
